HUMAN-COMPUTER INTERACTION

BEING HUMAN
HUMAN-COMPUTER INTERACTION
IN THE YEAR 2020

Interaction paradigm

Practice paradigm

A Responsible design approach?

Top-Down

Policy, accountability, organisational/societal change agendas

Middle-Out

Putting technologies & policies to work in everyday practice

Responsible design of enabling infrastructures

for ongoing co-evolution

Bottom-Up

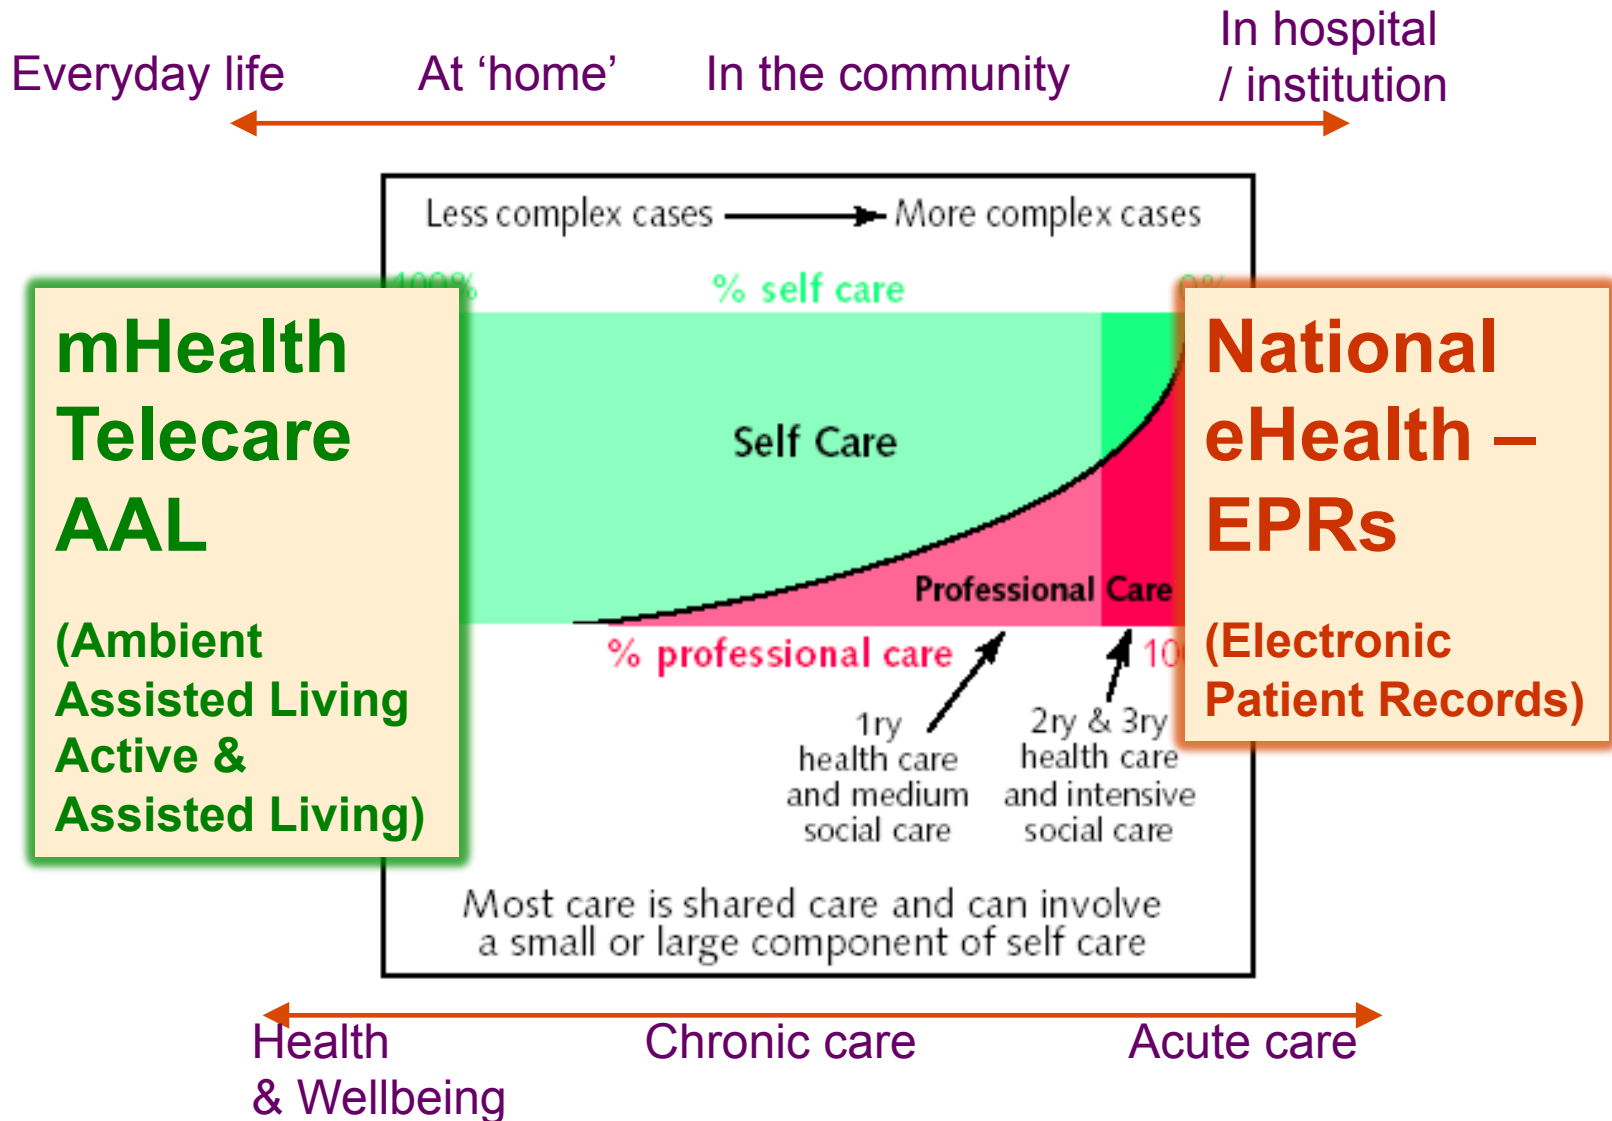

Interactions with systems in situated contexts

Responsible care

- AAL/telecare systems

Large scale IT/policy initiatives to meet healthcare challenges

Warum AAL AUSTRIA?

Auf Initiative des Bundesministeriums für Verkehr, Innovation und Technologie wurde im April 2012 die Plattform AAL AUSTRIA gegründet, mit dem Ziel, den Aufbau einer Ambient Assisted Living-Community in Österreich zu etablieren, das Zusammenführen von Anbietern und Anwendern/-innen zu fördern und einen effizienten Erfahrungsaustausch zwischen den Stakeholdern zu erreichen.

Despite huge Investments in Telecare/AAL ... experiences

Service implementation challenge

Not just tech but processes, roles, responsibilities...

To establish in the first place:

Eg Design of a COPD telehealth trial [Fitzsimmons et al, Jan 2011]

Required new arrangements between local authority & health care agency

To run in practice:

Eg Running a COPD telehealth trial [Sharma & Clarke 2014]

Nurses & community support workers' experience of telehealth as disruptive and threatening

Case I: Whose homes are these technologies for?

Kitchen

↪ bathroom

Sam's house

Sitting room

↪ bedroom

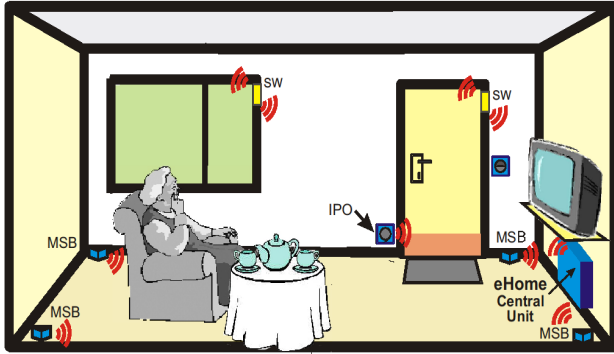

Who is being designed for or 'with'?

Home as a shared contended space
Autonomy vs control

Case 2: Interpreting eHome AAL data?

Making sense of everyday activities of life?

Disembodied
De-contextualised
De-personalised

What outcomes and for whom?

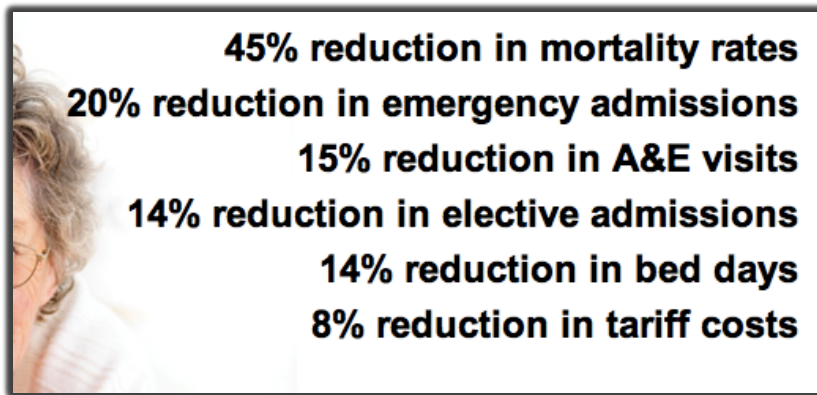

Weak evidence base weak

2011 systematic review: of 1835 initial articles, 74 included in review; only 4 ran trials with >20 people

[Brownsell et al, 2011]

Service-oriented outcomes

Eg UK Whole Systems Demonstrator [Steventon et al 2012]

[But contested eg critiques of [study design](#) and [cost](#)]

Experiences of older people?

Acceptance challenge of telehealth and telecare
works for some but certainly not all

Barriers to participation and adoption [eg Sanders et al 2012; Draper & Sorell 2012]

- Perceived lack of technical competence,
- Threats to identity and independence,
- Concerns about disruptions to existing care services

“Not for me”

Experiences with the technology [eg Procter et al 2014]

- Medical appearances of devices
- Carry stigma attached to old age
- Need to alter daily routines
- Pragmatic adaptations

Photo courtesy of Stinne Aaløkke

How are technologies (inadvertently?) inscribing age, home, care?

Aging as physiological decline

- Costly healthcare problem

Home as extension to hospital

- Isolated, lonely, confined within home walls

Technological vision of care

- Goal – absence of alerts, reduced service use, etc

The monitored life worth living?

“And I’ll get old later but on my terms if I can keep learning and adapting and if we can keep compensating for the things that happen” [Jim]

Exploring values
'what is for me'

Embracing a 'middle out practice' perspective for AAL?

Re-thinking stakeholders, drivers, roles for tech

Everyday life practices
... habits, routines, values

&

Everyday org/work practices
...service re-design

AAL/telehealth

Passive monitoring
Reactive care

Professional care

Tools for active appropriation
Social engagement... **GIVE & TAKE**

Tools for collaborative sensemaking, new roles

Responsible sustainability

- The case of food waste

Current approaches to motivation & behaviour change

Policy

Individualistic,
rationalistic

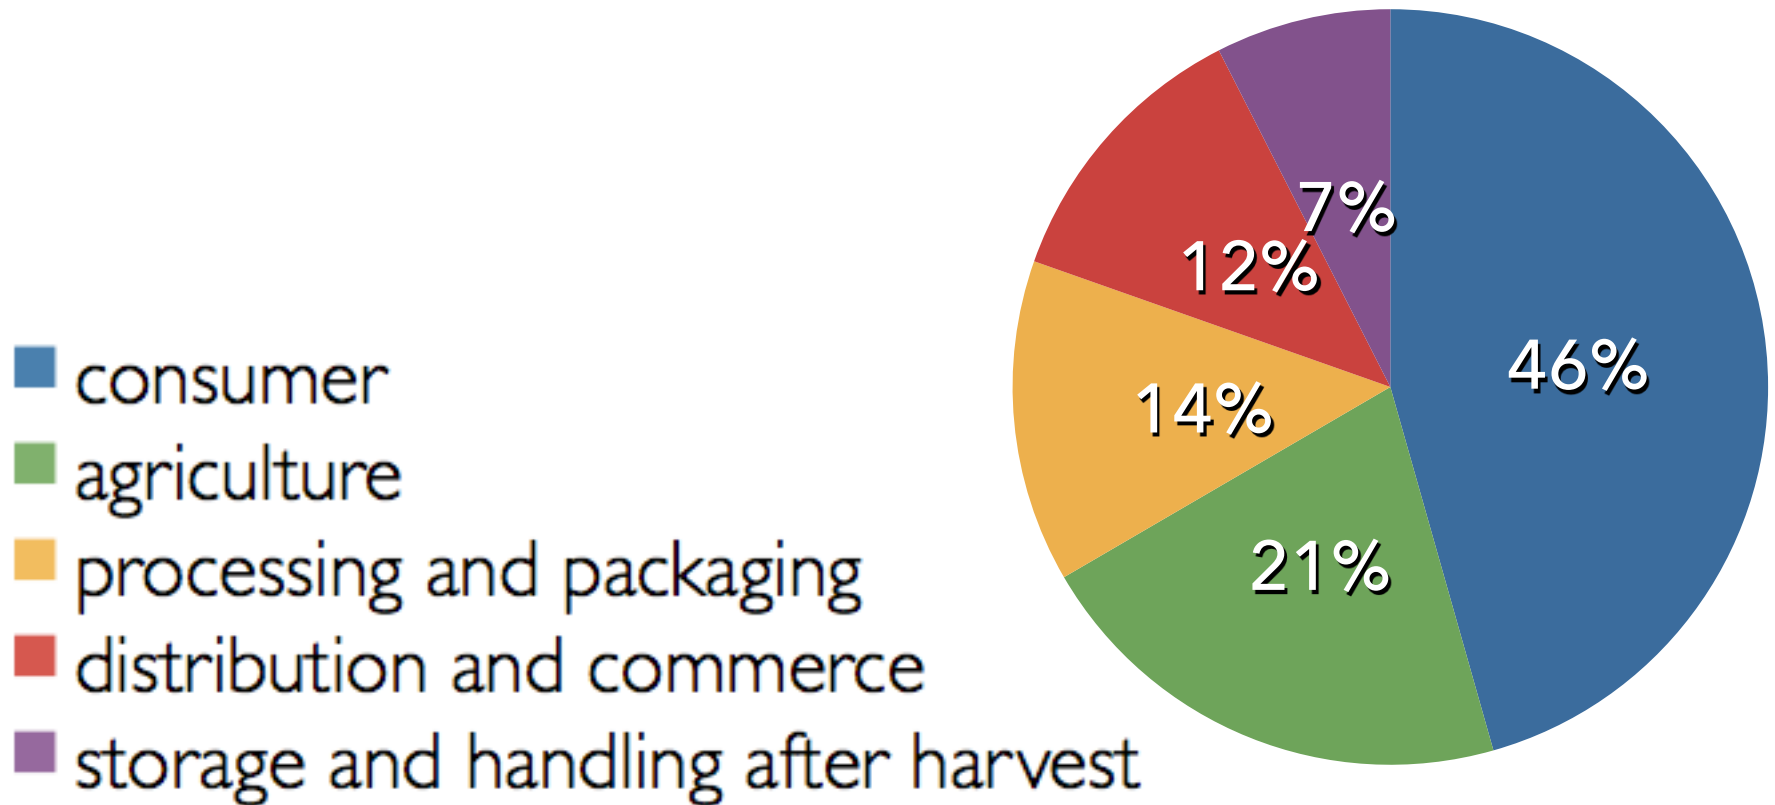

Behaviour

Design

Food wasted - 1/3-1/2 in industrial countries (Germany)

A photograph of a refrigerator interior. The shelves are filled with various food items, including a blue container of yogurt, a red container, a white container, and a green container. The lighting is bright, and the items are arranged in a somewhat cluttered manner. A white text box is overlaid on the middle of the image.

Understand mundane everyday practices around food and wasted food

Interviews & home tours in 14 households (Austria & UK)

- Practices around food and wasted food
- Values and key aspects in sourcing food
- Why food gets spoiled in the end

[Eva Ganglbauer –PhD work]

Technology Probe

Fridge cam

Picture taken by cam

Findings – intention-behaviour gap!

Temporal & social organisation of everyday life

“Well you never know what there is exactly in the fridge.

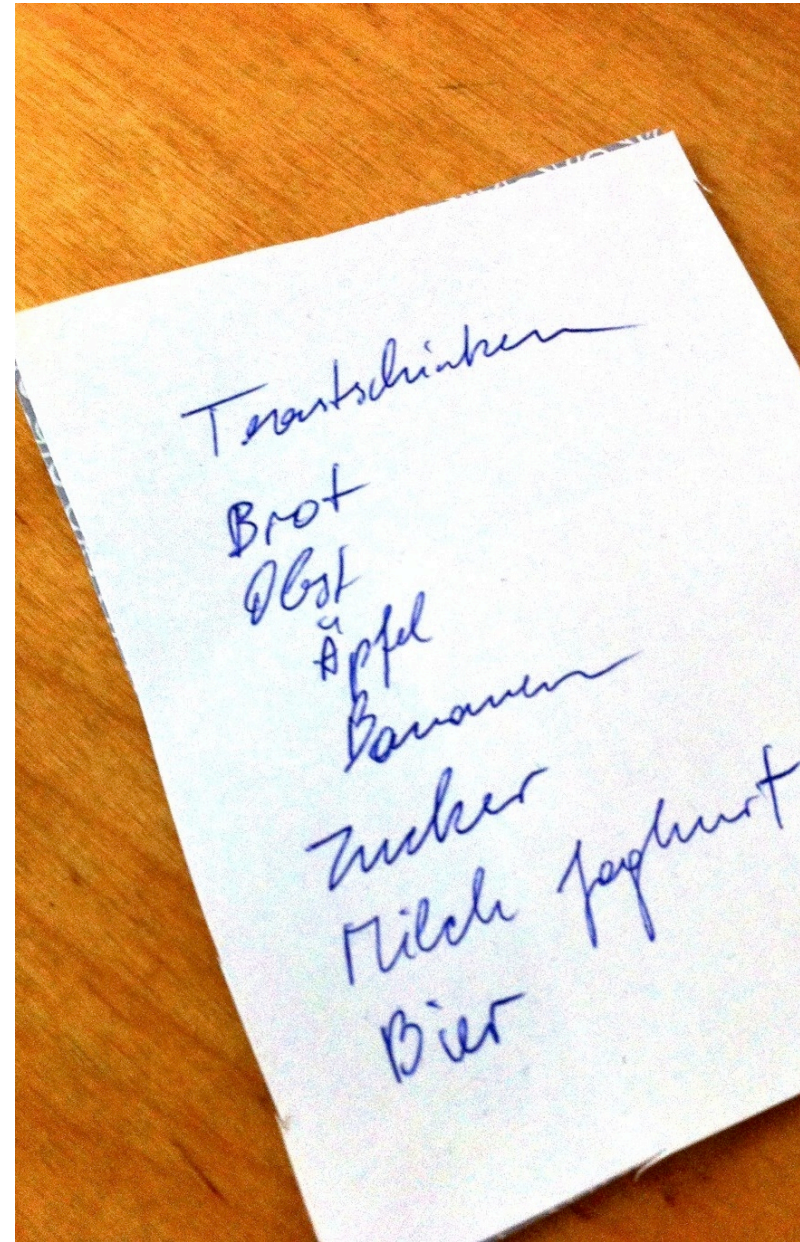

So shopping is nothing that is a planned act.

If there is time after work one grabs something.”

(Wilma)

Issues

- Planned/coordinated... or not
- Opportunistic shopping
- Unpredictability of social life, family needs

Geographical & spatial organisation of everyday life

“Luckily there are many food retailers around the corner”

(Sandra)

Issues

- Access & transportation
- Available space storage

Material organisation of everyday life

*“Well if I can have a big package for a little more money, **why** should I buy the smaller one?”*

But in the end, if I throw away the rest of it, it doesn't add up, so this [buying big packages] is nonsense then.”

(Susanna)

Issues:

- Balancing the budget
- The trap of big packages

“There is a ritual that [...] I free them [the cereals] from their packaging and put them into big glass jars. It also looks more fancy that way. [...]

*I do that **deliberately to have a better overview** of what I have.”*

(Susanna)

Positive strategies

- Creating visibility
- Creative cooking

Negotiating everyday practices

Food waste as...

Unintended/unwanted
outcome of negotiations
between practices

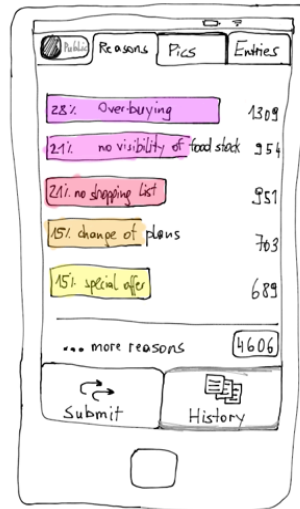

deeply embedded in everyday
social, spatial, cultural and
practical contexts [Blake 1999]

Not all within direct control

Supporting awareness & reflection on everyday practices

...Designing & evaluating a 'food waste' diary

Distributed via app stores

~1000 entries logged - currently being evaluated

From individuals/households to local communities...

**Taste The Waste – Rezepte und Ideen für
Essensretter**

Embracing a 'middle out practice' perspective for food waste?

Beyond the individual

- re-thinking levels of engagement & spheres of control and influence...

Everyday life practices
... habits, routines, values

*Embedded
in*

Everyday spaces &
politics & infrastructures

Beyond the individual
& 'behaviour' change...

to enabling communities... and activism...

Responsible design/ers

- Inscribing futures

Moving to a middle-out approach?

Top-Down

Policy, accountability, organisational/societal agendas

Middle-Out

Putting technologies & policies to work in everyday practices

Responsible design of enabling infrastructures

for ongoing co-evolution

Bottom-Up

Interactions with systems in situated contexts

- Beyond the individual ... to social, collective, pragmatic organisation of practices in everyday life
 - Real life as it unfolds
 - Situated in time and space
 - Diverse people, situations, experiences
 - Negotiations across multiple practices, stakeholders etc
- Technology just one aspect
 - Impacts of technology not given but a practical achievement
 - through being co-adapted, appropriated, put to work

Designers reflective about our own practices?

What futures are we ascribing by design? Whose voices, values? etc

Evolving methods to engage in 'middle out'?

■ Understanding:

- Broadening 'unit of analysis', stakeholders
- Negotiating diverse values, drivers
- Engaging with scale and 'larger' change processes

■ Designing:

- Focus on designing 'being human' (work, life, play) not technology
- Smaller scale cycles, agile methods... learn by doing, reflecting

■ Evaluating:

- Not reifying technology or assuming 'fixed state'
- Interpreting outcomes as *practical achievements in specific contexts*
- Unpacking social/contextual processes and conditions

Thank you
