Login information will be sent to registered participants the day before the presentation.

Sergei Scherbov¹ and Sergey Shulgin²
¹IIASA, ²RANEPA

The work is performed in a framework of IIASA-RANEPA project: "Short and long term consequences of COVID-19 on population dynamics in Russia and its regions" funded by IIASA and the Russian Foundation for Basic Research (RFBR). Conventional and probabilistic projections for Russia and its regions constitute the main results of the project. Russian Demographic datasheet 2022 is being developed based on those projections. We are developing probabilistic projections for 85 administrative regions of Russia considering urban and rural populations. Projections are based on long-term scenarios for fertility, mortality, and migration until 2050 developed by participants of the project.

Regional demographic diversity in Russia is very high and especially in longevity. Those differences have a strong effect on population distribution by age and sex.

The datasheet will also include regional estimates of excess mortality in 2020 due to the COVID-19 pandemic where a high level of diversity is also observed.

About the presenter

Sergei Scherbov is Principal Research Scholar and Project Leader at IIASA's Population and Just Societies Program.

Sergey Shulgin is vice-director at International Research Laboratory for Demography and Human Capital at The Russian Presidential Academy of National Economy and Public Administration (RANEPA) at Moscow (Russia).

The Wittgenstein Centre is a collaboration among the Austrian Academy of Sciences (OeAW), the International Institute for Applied Systems Analysis (IIASA) and the University of Vienna.
