Annette Baudisch

University of Southern Denmark

The purpose of this colloquium is twofold. First, to communicate new directions of research at the Danish Center for Population Research in Odense to explore potential areas of common interest with researchers at WIC. These include, among others, research on fertility, regional demography, and the interplay between demography and climate change. And second, to present recent results on mortality patterns and the rate of aging in humans, primates, and other species to discuss if and how existing theories and modeling within evolutionary demography, optimization approaches across disciplines and other approaches may help explain emerging regularities and apparent constraints on the rate of aging.

About the presenter

Professor Annette Baudisch is Director of Research at the Danish Centre for Demographic Research within the Interdisciplinary Centre on Population Dynamics | CPop at the University of Southern Denmark, Odense. Her research advances concepts, theories and methods to study age-patterns of mortality and fertility. Changing the question of “why we age” to “why we age, but some species do not”, and framing the pace-shape concepts of aging are her award-winning contributions to science. She recently acquired an ERC consolidator grant based on her recently developed Born once – Die once approach.

The Wittgenstein Centre is a collaboration among the Austrian Academy of Sciences (OeAW), the International Institute for Applied Systems Analysis (IIASA) and the University of Vienna.
