family, market & state

Life-course Heterogeneity and the Future Labor Force - A Dynamic Microsimulation Analysis for Austria

Wittgenstein Centre Conference 2023 „Exploring Population Heterogeneities Vienna, 6.12.2023

Thomas Horvath, Martin Spielauer, Philipp Warum

The project receives funding from the European Union's Horizon Europe Research and Innovation Programme under Grant Agreement number 101095175 and the UK Government.

- Projection of size and composition of the workforce 2022 - 2080
 - Accounting for demographic change, family, education, health, and institutional settings
 - Consistency with official population projections (STATAT) but accounting for education
 - Individual characteristics, e.g., education, migration background, health
 - Policy tool: identification of policy levers affecting labor careers; scenario-support
 - Changes affecting specific groups or Institutional settings
 - Starting point for two Case Studies in SustainWELL Project (migration & retirement / pensions)
 - Requirements
 - Longitudinally consistent careers from education, first labor entry until retirement, reflecting the real life heterogeneity of employment careers
 - Detailed pension regulations: types, reforms, eligibility rules based on individual careers
 - Realistic modeling of labor transitions, accounting for path dependency
- Capturing the heterogeneity of individual life courses enhances the accuracy, detail, and policy relevance of population and labor force projections

- Two models at WIFO:
- **microWELT:** Comparative model used as a platform in various international projects based on harmonized or comparable data sources (EU-SILC, LFS,...)
 - Böheim et al. (2023) The Impact of Health and Education on Labour Force Participation in Aging Societies: Projections for the United States and Germany from Dynamic Microsimulations, *Population Research and Policy Review*, 42, (3)
 - Spielauer et al. (2023), The Effect of Educational Expansion and Family Change on the Sustainability of Public and Private Transfers, *Journal of the Economics of Ageing*, 25
- **microDEMS:** more detailed model for Austria based on cross-sectional (LFS, STATAT,..) and longitudinal data (ÖGK, DSVS,..)
 - Horvath et al.(2023) Socio-economic Inequality and Healthcare Costs Over the Life Course – A Dynamic Microsimulation Approach - *Public Health* (219), S.124-130
 - Horvath et al. (2023) Older Persons in the Labour Market: A Forecast until 2040 as a Basis for Economic Policy Measures, WIFO-Report.
 - Angel et al.(2023) Activatable Labour Market Potentials and "Hidden Unemployment" in Austria, WIFO-Report.

- Design
 - **Interacting population model** operating in **continuous time** (things can happen at any time); individuals **linked to families**
 - **Support of (optional) alignment to external targets** allowing reproducing official population projections, and scenarios concerning unemployment etc. while maintaining relative differences in risks by individual characteristics.
- Modgen/openM++
- Detailed biographies (schooling, family formation, employment careers, retirement)
- Base Scenario
 - Keep all factors impacting on labor force participation constant (health, age, education, family & job characteristics)
 - but account for changing retirement age of women (old age: +5 years; early +4 years)
 - **Pension law requires full life-time accounting!**
 - **realistic labor market careers**

microDEMS – Employment Transitions

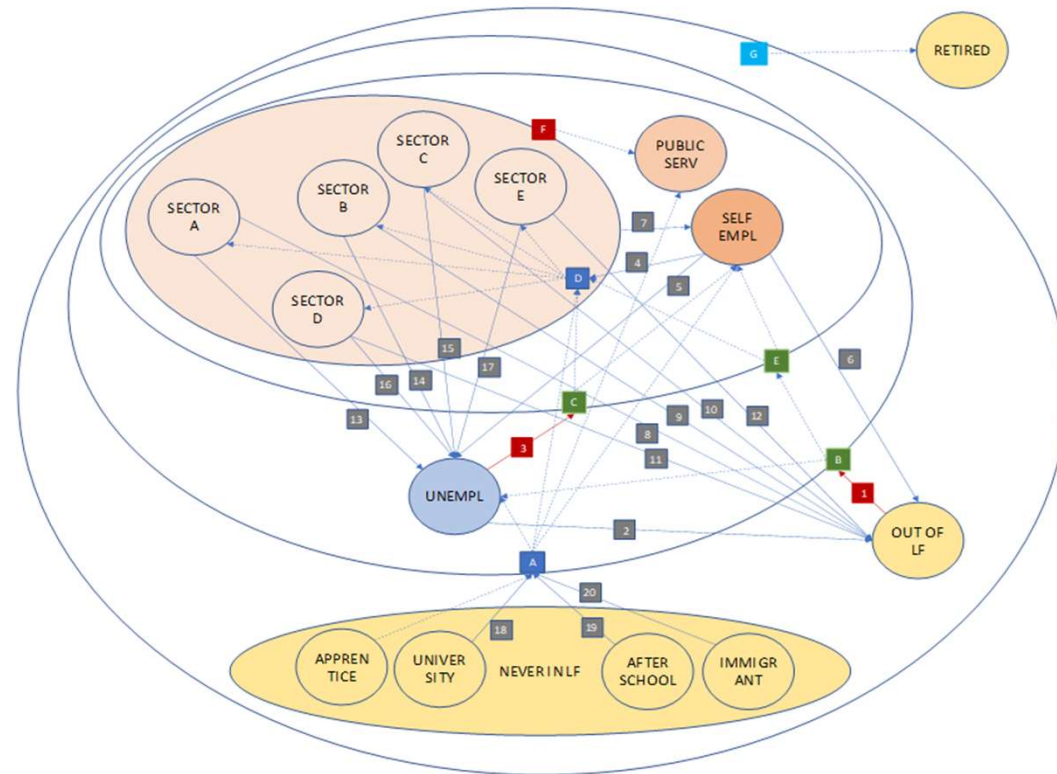

Labor market model reflects real-life mobility between labor market states

- Implemented by hazard regressions accounting for personal and family characteristics as well as duration of current state (path dependency)

- Sectoral differences

Estimated on admin data

- ~100% population covered
- Health data
- Universe of employment spells

Change in labor force by education attainment

Absolut difference to 2022

Components of total change in labor force 2022 to 2040

Baseline Scenario

Active vs. Total population

Base scenario and alternative scenarios

- Departing from official population projections, we are able to simulate the evolution of the population and it's workforce in detail
- Based on individual life-courses, our model allows for detailed analysis exploring population heterogeneity to a high degree
- microDEMS allows to assess how changes in the underlying parameters affect results
- As an ex-ante policy tool our model empowers the evaluation of different policy measures on socio-economic outcomes in the medium and long term
